

Social Post Generation

R&D; Workflow Plan - Client Showcase Prototype

OBJECTIVE	Validate an AI-assisted workflow that turns a short advertisement brief into a clear, ready-to-review social post. The R&D; focuses on reliable structured content and a polished local visual preview for client demonstration.
-----------	--

Current Scope

A lightweight local prototype: prompt entry, backend orchestration, Gemini-generated structured content, and a simple social-post preview. It is designed to prove the concept and make the output easy for a client to assess.

End-to-End Workflow

The backend sends the brief through Vertex AI to Gemini, receives a predictable JSON response, and passes it to the local preview UI for presentation.

Structured Output

Field	Purpose
caption	Main social-media copy written from the user brief.
offer / key message	Core promotion, announcement, or value proposition to emphasize.
CTA	Clear next action, such as visit, order, enquire, or learn more.
hashtags	Relevant discoverability tags formatted for social platforms.

Showcase UI Purpose

The UI is a presentation layer, not the eventual product. It lets the client see the generated caption, offer, CTA, and hashtags as a coherent social post instead of evaluating raw JSON alone.
--

Scope Boundaries and Next Step

IN SCOPE	OUT OF SCOPE FOR THIS R&D;
- Prompt input and generation trigger - Local backend integration - Vertex AI and Gemini 2.5 Flash-Lite - Structured JSON response - Local social-post preview and regenerate option	- Platform APIs, publishing, and scheduling - User authentication and account management - A production application or full frontend - Video or audio generation
RECOMMENDED R&D; DELIVERABLE	Gemini API integration + local backend + simple showcase UI. The design remains extensible: future platform adapters can translate the approved structured JSON into platform-specific publishing workflows when that scope is authorized.
