

AddLyft

Social Post Image

MVP Overview for Clients

A short overview of what we built, how it works in plain terms, and what you can expect from this first working version.

Status	Working demo ready
What it creates	A finished social media advertisement image
Date	21 September 2026

What this is

This MVP helps a store or brand create a **ready-to-post advertisement image** for social media. You describe the promotion in everyday language, optionally add a few product or style photos, and the system produces one finished poster.

Think of it like giving a designer a brief and a few reference photos — except the first draft comes back in seconds, not days.

How it works (simple view)

1. **Write a brief** — product name, offer, headline, and any instructions (example: “Lay’s chips, 3 for the price of 2, AMPM Woodstock”).
2. **Add photos (optional)** — up to 3 images, such as the real product pack or a style example you like.
3. **Click Generate** — the system creates one final advertisement image.
4. **Review the result** — see the poster plus time taken and estimated cost.

Important: each normal generate uses **one AI call only**. We do not run hidden extra steps that raise cost without asking.

What you get today

Capability	Details
Output	One social advertisement image (tall 9:16 format — good for Stories / Reels)
Store branding	Defaults to AMPM Woodstock unless your brief names another store

Reference photos	0 to 3 — product look, store feel, or visual style
Speed (typical)	About 8–35 seconds per image
Cost (typical)	About \.03–\.04 per image (estimate)
Demo	Simple local web screen: type brief → upload photos → generate

Example brief

“Create an AMPM Woodstock ad for Lay’s Potato Chips. Headline: CRUNCH MORE. Subhead: SAVE MORE! Offer: GRAB 3 BAGS FOR THE PRICE OF 2. CTA: GRAB YOUR FAVORITES! Keep packaging accurate if product photos are provided.”

With a product shelf photo and a style reference, the system returns a single poster that aims to match the offer text and product look.

What this version is not

This is a focused first version to prove the visual flow. It does **not** yet include:

- A polished public website or customer login
- Auto-writing of captions and hashtags (that is a separate text tool in the same project)
- Video ads
- Automatic “fix-up” edits after every generate (corrections are only if you ask)

Why this matters

- **Faster creative** — go from offer idea to a visual draft quickly.
- **Controlled cost** — one generation step per poster keeps spend predictable.
- **Brand-aware drafts** — reference photos help keep the real product look in the ad.
- **Clear next path** — once approved, this can move into a fuller AddLyft product experience.

Suggested next steps

- Review a few live demo posters with your team and note what looks right / wrong.
- Decide when to connect this into the main AddLyft product screen.
- Optionally offer a higher-quality (higher-cost) image option for premium campaigns.
